Adventure Website

HTML and CSS Code with Explanation

1. Objective

Create a simple adventure tourism webpage that introduces outdoor activities, shows popular adventures, and encourages visitors to explore.

2. Main Features

• Hero heading and welcome text

• Adventure activity cards

• Basic navigation links

• Responsive layout for smaller screens

• CSS colors, spacing, borders, and hover transitions

3. Files Required

Create two files in the same folder: **index.html** and **style.css**. The HTML file contains page content; the CSS file controls colours, layout, fonts, spacing, and responsive behaviour.

4. HTML Explanation

<!DOCTYPE html> — Tells the browser to use modern HTML.

<head> — Contains page title, character encoding, mobile viewport settings, and the CSS link.

<header> and <nav> — Create the top banner and navigation links.

<section> and <article> — Organize the page into sections and individual content cards.

<img> — Displays an image; alt text describes it for accessibility.

<footer> — Shows the final copyright or information line.

5. CSS Explanation

box-sizing: border-box — Includes padding and borders in an element's width calculation.

background / linear-gradient — Adds a background image and a dark overlay so white text is easier to read.

display: flex — Places navigation items in a row and spaces them out.

CSS Grid and auto-fit — Arranges cards in columns that adapt to available screen width.

object-fit: cover — Fills each image box without stretching the image.

:hover and transition — Adds a smooth visual effect when the pointer moves over a link or card.

@media (max-width: 600px) — Changes navigation layout on smaller screens.

6. How to Run

• Open a text editor such as Notepad or VS Code.

• Save the HTML code as index.html.

• Save the CSS code as style.css in the same folder.

• Double-click index.html to open it in a web browser.

• An internet connection is needed to load the online Unsplash images. Replace sample contact details, date, venue, prices, or address with your own information.

7. Conclusion

This beginner-friendly project demonstrates HTML page structure and CSS styling. It can be extended with a real registration form, booking system, or backend when needed.
